1. Getting Started

DevTools Hub is a collection of 50+ free, fast developer tools that run entirely in your browser. Your data never leaves your device — there are no uploads, no server processing, no tracking, and no sign-up required.

How to use: Visit the homepage, find the tool you need by browsing categories or using the search bar, click on it, and start using it immediately. Results appear in real-time as you type.

Privacy: All encoding, decoding, hashing, formatting, and conversion happens client-side using JavaScript and the Web Crypto API. Image tools use the HTML5 Canvas. Server-side API routes are only used for tools that need to make external network requests (like Website Status Checker and HTTP Headers Parser).

2. Utilities

Website Status Checker

Check whether a website is online or not.

How to use: Enter a URL (e.g. google.com) and click 'Check Status'. The tool pings the site via our API and reports the HTTP status code and response time.

User Agent Finder

Find out your browser's user agent string.

How to use: Simply open the tool — your user agent is detected and displayed automatically. Click 'Copy' to copy it to your clipboard.

What's My IP

Find out your public IP address.

How to use: Opens and instantly displays your public IP address as detected by our server. Useful for debugging network issues.

Ping

Measure HTTP latency for any address.

How to use: Enter a hostname or URL. The tool sends 5 HTTP HEAD requests and shows response time for each, plus min/avg/max stats.

URL Unshortener

Unshorten a URL and find the original.

How to use: Paste a shortened URL (bit.ly, t.co, etc.) to reveal the full destination URL. Coming soon.

URL Encoder

Encode your URL to make it transmission-safe.

How to use: Paste any text or URL. The encoded version appears instantly using JavaScript's encodeURIComponent().

URL Decoder

Decode any URL that has been encoded.

How to use: Paste a percent-encoded string. The decoded version appears instantly using decodeURIComponent().

SSL Checker

Verify SSL certificate of any website.

How to use: Enter a domain to check its SSL certificate validity. Coming soon.

HTTP Headers Parser

Parse and inspect HTTP headers of any URL.

How to use: Enter a URL and click 'Get Headers'. Our API fetches the headers and displays them in a formatted table with header name and value.

QR Code Reader

Read and decode QR codes from images.

How to use: Upload an image containing a QR code to decode it. Coming soon.

Email Validator

Check if an email address is valid.

How to use: Type an email address. The tool validates the format in real-time using a regex pattern and shows a green/red indicator.

YouTube Thumbnail Downloader

Download thumbnails from any YouTube video.

How to use: Paste a YouTube URL or video ID. All available thumbnail sizes (max, SD, HQ, MQ, default) are displayed instantly — click to open.

Redirect Checker

Trace URL redirects and hops.

How to use: Enter a URL and click 'Trace Redirects'. The tool follows each redirect hop and displays the chain with status codes.

3. Encoders & Decoders

Base64 Encode

Encode text to Base64 format.

How to use: Type or paste any text. The Base64-encoded output appears instantly. Supports Unicode text via UTF-8 encoding.

Base64 Decode

Decode Base64 back to plain text.

How to use: Paste a Base64 string. The decoded plain text appears instantly. Shows an error message for invalid Base64 input.

ROT13 Encoder

Encode text using the ROT13 cipher.

How to use: Type any text. Each letter is shifted 13 positions in the alphabet. Numbers, spaces, and symbols are preserved.

ROT13 Decoder

Decode ROT13-encoded text.

How to use: Paste ROT13 text. Since ROT13 is its own inverse, encoding and decoding use the same function.

Binary to Text

Convert binary code to readable text.

How to use: Enter space-separated 8-bit binary values (e.g. 01001000 01101001). Each byte is converted to its ASCII character.

Text to Binary

Convert text to binary representation.

How to use: Type any text. Each character is converted to its 8-bit binary representation, space-separated.

Punycode to Unicode

Convert Punycode to Unicode characters.

How to use: Enter a Punycode-encoded domain (e.g. xn--nxasmq6b). The Unicode equivalent is displayed.

Unicode to Punycode

Convert Unicode to Punycode encoding.

How to use: Enter a Unicode domain (e.g. münchen.de). The Punycode-encoded version is displayed.

4. Converters

Hex to RGB

Convert hex color codes to RGB values.

How to use: Enter a hex color code (with or without #). The RGB value is displayed along with a color preview swatch.

RGB to Hex

Convert RGB values to hex color codes.

How to use: Enter R, G, B values (0-255). The hex code is displayed along with a color preview swatch.

Timestamp Converter

Convert between Unix timestamps and dates.

How to use: Two panels: enter a Unix timestamp to convert to ISO date, or enter a date string to get the timestamp. 'Now' button fills the current time.

Markdown to HTML

Convert Markdown text to HTML.

How to use: Type Markdown syntax (headings, bold, italic, links, lists). The HTML output appears in real-time.

HTML to Markdown

Convert HTML back to Markdown.

How to use: Paste HTML code. The Markdown equivalent is generated, converting tags to their Markdown syntax.

CSV to JSON

Convert CSV data to JSON format.

How to use: Paste CSV data with a header row. Click 'Convert' to get a formatted JSON array of objects.

JSON to CSV

Convert JSON data to CSV format.

How to use: Paste a JSON array of objects. Click 'Convert' to get CSV with headers extracted from object keys.

Memory Storage Converter

Convert between bytes, KB, MB, GB, and TB.

How to use: Enter a value and select the source unit. All other unit conversions are displayed simultaneously in a grid.

5. Image Tools

JPG to PNG / JPG to WebP

Convert JPG images to PNG or WebP format.

How to use: Click to select a JPG file. Click 'Convert' — the image is processed in your browser using HTML5 Canvas. Click 'Download' to save.

PNG to JPG / PNG to WebP

Convert PNG images to JPG or WebP format.

How to use: Same workflow as above. The conversion happens entirely client-side — your images are never uploaded.

WebP to JPG / WebP to PNG

Convert WebP images to JPG or PNG format.

How to use: Select a WebP file, convert, and download. All processing happens in the browser.

Image Compressor

Compress images without losing quality.

How to use: Select an image, adjust the quality slider (10%-100%), click 'Compress'. Shows original vs. compressed size and percentage saved.

Image Resizer

Resize images to any dimension.

How to use: Select an image. Enter new width/height. 'Lock ratio' keeps the aspect ratio. Click 'Resize' then 'Download'.

Image to Base64

Convert images to Base64 encoded strings.

How to use: Select any image. The full data URI (data:image/...) is displayed and can be copied for use in CSS, HTML, or APIs.

6. Generators

Password Generator

Generate strong, random passwords.

How to use: Set length (4-128), toggle character types (uppercase, lowercase, digits, symbols).

Click 'Generate'. Uses `crypto.getRandomValues()` for true randomness.

UUID Generator

Generate random UUIDv4 identifiers.

How to use: Set the count (1-100) and click 'Generate'. Uses `crypto.randomUUID()` for cryptographically random UUIDs.

QR Code Generator

Generate QR codes from any text or URL.

How to use: Enter text or a URL and click 'Generate QR'. The QR code image can be downloaded as PNG.

Lorem Ipsum Generator

Generate placeholder text for designs.

How to use: Set the number of paragraphs (1-50) and click 'Generate'. Each paragraph has 40-80 random Latin words.

Random Number Generator

Generate random numbers in any range.

How to use: Set min, max, and count. Click 'Generate' to get random integers in the specified range.

7. Security & Encryption

Bcrypt Generator

Hash passwords using a secure algorithm.

How to use: Enter a password, set the rounds (4-16), click 'Generate Hash'. Uses PBKDF2-SHA256 via Web Crypto API as a browser-compatible alternative.

MD5 Generator

Generate MD5 hashes from any text.

How to use: Enter text and click 'Generate MD5'. Uses a pure JavaScript MD5 implementation.

Note: MD5 is not recommended for security — use SHA-256 instead.

SHA Generator

Generate SHA-1, SHA-256, and SHA-512 hashes.

How to use: Enter text, select the algorithm, click 'Generate'. Uses the Web Crypto API's `SubtleCrypto.digest()` method.

Hash Generator

Generate various hash digests from text.

How to use: Enter text and click 'Generate Hashes'. Produces SHA-1, SHA-256, and SHA-512 all at once for comparison.

Password Strength Test

Test how strong your password is.

How to use: Type a password. A real-time strength meter shows 7 criteria: length (8+, 12+), uppercase, lowercase, numbers, symbols, and common pattern detection.

8. Formatters & Beautifiers

JSON Formatter

Format and beautify JSON data.

How to use: Paste JSON, choose indent (2 or 4 spaces), click 'Format' to beautify or 'Minify' to compress. Shows syntax errors for invalid JSON.

HTML Formatter

Beautify and indent HTML code.

How to use: Paste HTML and click 'Format'. The tool parses tags and applies proper indentation. Self-closing tags are handled correctly.

CSS Formatter

Format and beautify CSS code.

How to use: Paste CSS and click 'Format' to beautify or 'Minify' to compress. Adds proper line breaks after properties and braces.

JavaScript Formatter

Beautify and format JavaScript code.

How to use: Paste JS code and click 'Format'. Adds indentation based on braces, brackets, semicolons, and commas.

SQL Formatter

Format and beautify SQL queries.

How to use: Paste a SQL query and click 'Format'. Keywords (SELECT, FROM, WHERE, etc.) are uppercased and placed on new lines.

XML Formatter

Format and beautify XML documents.

How to use: Paste XML and click 'Format'. Applies proper indentation based on nesting level.

9. SEO Tools

Meta Tags Generator

Generate meta tags for better SEO.

How to use: Fill in the title, description, keywords, and canonical URL. The tool generates standard meta tags and Open Graph tags in real-time.

Open Graph Generator

Generate Open Graph tags for social sharing.

How to use: Fill in title, description, URL, image URL, and site name. Copy the generated og: meta tags and paste them into your HTML head.

Twitter Card Generator

Generate Twitter Card meta tags.

How to use: Select card type (summary or summary_large_image), fill in the fields. Copy the generated twitter: meta tags for your site.

DevTools Hub

Built for developers. Free forever.
